CHEAT SHEET

What makes a number safe to pay for?

Monday teaches six topics first, on examples whose numbers are invented, then applies them to a case. Illustrative case: the company is real, the situation and the data are synthetic, built for this class. Uber, Hyderabad: from 31 August 2026 an enrolled driver online through a whole peak window is guaranteed Rs 300 per peak online hour, with a top-up for the gap. Six weeks each side: peak online hours up 24 percent, trips up 3 percent, trips per peak online hour 1.90 to 1.58, offers accepted 0.86 to 0.73, median wait 4.8 to 4.6 minutes, top-up Rs 0 to Rs 1.9 crore. Data: `drivers`, `driver_weeks`, `zone_weeks`. Ask, by Friday: is it working, what should it pay for, is anyone gaming it? Caveats: monsoon's end, 140 new drivers, online means the app is open, three thin outer zones, drivers on two apps.

1 Which six topics does Monday teach, and where does the case use them?

Crux. Chapters 1 to 3 choose the number, chapters 4 and 5 write it so it cannot be gamed, and chapter 6 puts both on one page: canteen tokens 1.0 to 2.0 a plate, a pass rate 0.60 to 0.90 as licences fell to 0.36, 10.0 an over needed at over 10, five readings of one register, 50 marked against 40 confirmed (all invented).

2 What does the finished board say about a number worth paying for?

Crux. Judge it by completed peak trips per enrolled driver online at peak, guarded by acceptance, the wait and top-up per trip; hours rose 24 percent as trips per hour fell from 1.90 to 1.58.

3 What did six drivers do, counted by hand?

Driver, zone	Hours, week of 10 Aug then 21 Sep	Trips, the same two weeks
A, Jubilee Hills	10 then 11	21 then 22
B, Banjara Hills	9 then 10	17 then 18
C, Gachibowli	11 then 12	22 then 23
D, Madhapur	10 then 11	19 then 20
E, Shamshabad	10 then 16	18 then 3
F, Rajendranagar	10 then 14	17 then 2
All six	60 then 74, up 23 percent	114 then 88, down 23 percent

E and F keep shorter weeks than the idle tail's average of about 39 peak online hours a driver-week, which chapter 8's full data shows.

Crux. 114 / 60 = 1.90 and 88 / 74 = 1.19: add, then divide once. Two of six are in the idle tail against 15 percent of the city, which falls only to 1.58.

4 What are the seven lines of a complete definition?

Line	In plain words	The redesign
Numerator	What is counted	Peak trips completed, one per paying rider
Denominator	Divided by, count printed	Enrolled drivers online one peak hour or more
Window	The stretch of time	The calendar week
Exclusions	Left out, with why	Cancelled trips, test accounts, off-window trips
Does not reward	Behaviour paid nothing	Hours online, declines, a shrinking base
Guardrails	Must not get worse past a margin	Riders: accepted share over an acceptance floor, read with the cancel share; the wait by zone. Budget: top-up per trip
Gaming note	What each guardrail catches	Declines and cancels; lost supply; a runaway top-up

Crux. The first four lines make a number computable; the last three make it hard to game. North star 35.76 to 35.89 trips per online driver-week.

5 What is the proxy test?

Could a team hit this number while the thing it stands for got worse?

Proposed number	How it rises badly	The guardrail
Peak online hours	Online in empty zones	Hours with no trip: 0.22 to 0.38
Completed trips per driver	Short trips only	Offers accepted, over an acceptance floor
Enrolled drivers	Sign up, never drive	Share online at peak

Crux. A guardrail is chosen by the harm or gaming it catches; a growth target catches nothing.

6 What did hours cost, and what would the redesign save?

Rs 1.9 crore bought 6,700 more trips, about Rs 2,836 each, or about Rs 7,400 each net of the rise in requests; **Rs 1.159 crore** went to weeks accepting under half their offers, all of them the idle tail's. Rule: the Rs 300 floor stays only for weeks accepting half, an accepted trip later cancelled counted as declined.

Crux. Saving Rs 92.7 lakh if a fifth of the idle top-up is still paid, Rs 58 lakh if half is: an assumption with a range, settled by a test.

THE WORDS ON THIS SHEET

Metric A number a person watches in order to decide something

Target A metric with a value somebody is asked to hit

Proxy A number that stands in for the thing wanted

Proxy test Could a team hit this number while the thing it stands for got worse?

North star The one number that best captures the value the people served get

Guardrail A number watched beside the number being chased, which must not get worse...

Acceptance floor The least share of offers a driver-week must accept to earn the Rs 300 floor

Leading indicator A number that moves before the north star, while the team can act
