CHEAT SHEET

Will one slide carry the redesign, and is the estimate sane?

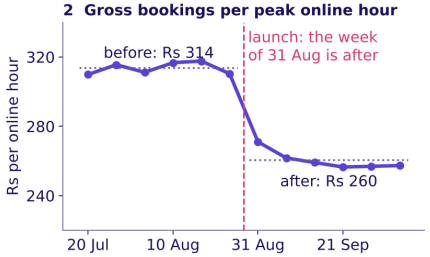

Uber, Hyderabad, one day on. Illustrative case: the company is real, the situation and the data are synthetic, built for this class.

5 panels, 1 diagram

1 What does a slide that carries a decision look like?

1 The scheme is paying for online hours that carry no trips

2 Gross bookings per peak online hour

2 and 61% of the Rs 1.9 crore top-up paid driver-weeks that accepted fewer than half their offers

3 Caveat

The monsoon ended inside the six weeks, and last year's weeks are missing, so part of the fall may be the season.

4 Action, the city head signs

Pay per completed peak trip with an acceptance floor, tested first on half the drivers at random: Rs 58 lakh to Rs 92.7 lakh saved over six weeks.

Appendix: one page per question a role will ask

Crux. A slide carries one claim, one number with its denominator, the caveat in sight and the action with its cost.

2 What do the twelve rows say, read three ways?

Read	Six drivers, two weeks	All driver-weeks
Per peak online hour	Rs 313.5 to Rs 196.2	Rs 314 to Rs 260, down 17 percent
Per active driver-week	Rs 3,135 to Rs 2,420	Rs 5,817 to Rs 5,861, up 0.8 percent
Per trip	Rs 165 both weeks	Rs 165 both windows

Crux. Name the denominator before the number.

3 How do you answer an objection that is partly right?

Move	What you say
Restate	The objection, until its owner agrees
Answer	From a named line of the evidence
Concede	The true part, out loud
Change my mind	The fact that would move you

Crux. Answer an objection in four moves.

4 How do you size a number from nothing?

Step	Drivers online at the weekday evening peak
Clarify	One moment of the evening window, one product, trips counted
Map	(Trips an hour / trips per online driver-hour) x buffer
Calculate	8,330 / (2.4 x (1 - 0.30 idle)) x 1.15 = about 5,700; 2,900 to 8,600 by trips per person
Validate	Case: 0.53 driver-hours per trip; chain: 0.60, an eighth high, so about 5,000 to 5,700

Crux. Size a number in four steps, give the factor that drives the range, and check it like for like.

5 Which check counts, and which traps does it catch?

Test	The trap it catches
Unit	Two million people as eight million households: multiplied by four, never divided
Period	September's 24.07 billion over 31 days gives 776 million; September has 30, so 802 million a day
Definition	Flipkart's text says 6.3 million "concurrent in a minute" and its web address says 63: read the source's own words

Crux. Check in the same unit, period and definition.

THE WORDS ON THIS SHEET

Claim The sentence the slide wants the reader to act on

Denominator What a total is divided by

Gross bookings What riders paid for trips, before Uber's share and any top-up

Active driver-week One driver with a row in the week's table

Caveat What the evidence cannot show yet

Appendix page A page behind the slide, headed by one role's question
