

1 What is revenue made of, with Monday's numbers on it?

Crux. Revenue is customers times orders per customer times average order value; the identity 23 x (30 / 23) x (Rs 5,44,810 / 30) lands on Rs 5,44,810.

2 Chapter 1: which total is sales?

Wrong number	Rs 5,44,810 is called sales, with 4 cancelled store orders inside it.
Check	Count by status first: 21 delivered, 5 returned, 4 cancelled.
Fix	Not cancelled is Rs 5,35,760 on 26 orders; delivered is Rs 5,20,790 on 21.

Crux. Name the definition before the number: booked, "not cancelled", or delivered.

3 Chapter 2: why must a branch use one definition?

Wrong number	AOV is Rs 25,943: booked rupees over delivered orders.
Check	AOV x the 30 orders the revenue covers gives Rs 7,78,300 against Rs 5,44,810.
Fix	Rs 18,160 booked, or Rs 24,800 delivered, each named.

Crux. Build every fraction on one definition, and check that it multiplies back.

4 Chapter 3: do customers come back?

Wrong number	30 customers, so 30 / 30 = 1.00 and "nobody comes back".
Check	len(rows) against len(set(ids)): 30 against 23.
Fix	23 customers, 1.30 orders each; 7 came back and 16 bought once.

Crux. Count customers by their id, never by the rows.

5 Chapter 4: what is a typical order?

Wrong number	A first order is valued at the mean, Rs 18,160.
Check	Orders above the mean: 1 of 30.
Fix	The median, Rs 2,205 booked or Rs 2,060 delivered; the mean stays for totals.

Crux. Report the median when one order can move the mean, and say why.

6 Chapter 5: which branch first?

Wrong number	Customers +10 percent and frequency +10 percent called 20 percent, Rs 77,772.
Check	1.10 x 1.10 = 1.21: Rs 78,420 on the consumer segments' Rs 64,810.
Fix	Rs 9,722 more needs 15 percent more customers or orders; frequency has the evidence.

Crux. Lifts multiply along the tree: two 10 percent lifts make 21 percent.

7 Chapter 6: are the one-time buyers lost?

Wrong number	16 of 23 bought once, so "70 percent are lost".
Check	Median repeat gap 45 days; 9 of the 16 bought in the last 45.
Fix	7 came back, 7 are past the usual gap, 9 are too recent to judge.

Crux. A one-time buyer is not a lost customer until they have had time to come back.

8 What will Meera sign?

"23 customers, 1.30 orders each, a typical order of Rs 2,205; 7 came back and 9 are too recent to judge, so open frequency first and hold the Rs 12 crore for Tuesday's two quarters."

Crux. The sentence names its definition, its branch and its caveat, and waits for a second quarter before the budget.

THE WORDS ON THIS SHEET

- Revenue tree Revenue is split into metrics that multiply.
- Delivered revenue It counts orders that arrived and stayed.
- Identity check Branches multiplied back must give the total.
- Distinct customers Each customer id is counted once.
- Booked revenue It counts every order placed.
- Denominator It is what a metric divides by.
