

1 The only equation of the day

Crux. A cleaning pass that cannot produce input equals clean plus rejected is a pass nobody can check, and the rejected rows are a deliverable rather than a by-product.

2 Profile before you decide

Count	The question it answers
Present	How many records carry the field at all
Convertible	How many of those become the type you need
Distinct	How many different values there are

Distinct is the one that catches a migration. 201 rows carrying 186 order ids is a finding before anything is removed.

3 Three answers, always

Choice	What it costs
Drop the row	The count changes and revenue falls
Default it	The count holds and the value is a guess
Keep and flag	Nothing is lost and somebody must look

Crux. There is no free option, so the decision, the reason and the row count go in the log as you make them, because writing the log afterwards means writing it from memory.

4 The identity rule

Same	Different	Verdict
Every field	Nothing	A duplicate, remove one
The order id	The date	One order, twice. Pick, and record which.
All but the id	The id	Two real orders. Keep both.

A duplicate is a row that **is the same order**, not one that looks the same.

5 The errors of the day

Message	What it means
FileNotFoundError	The path, not the file, is usually wrong
ValueError: invalid literal for int()	A word where a number belongs
JSONDecodeError: Unterminated string	The transfer was cut, so ask for the file again

A truncated file is a complete file that stops early. Patching it invents data.

6 The bridge

Rs 2.10 crore as exported, less 15 duplicate ids, less one row with no status, less one amount that will not convert, gives Rs 1.90 crore.

Crux. A bridge that does not land on the other system's figure has a step missing, and the missing step is the finding rather than a rounding difference.

7 What must not be cleaned

The Rs 4,80,000 corporate order is an outlier and it is real. It survives, and the log records that it was looked at and kept.

Remove every uncomfortable row and you have a dataset that agrees with you. Report it and describe the file with a median.

THE WORDS ON THIS SHEET

- Profiling** Counting present, convertible and distinct per field, before any decision
- Reconciliation** Showing how one system's figure becomes another's, step by step
- Revenue bridge** That reconciliation drawn as steps, each carrying its own number
- Rejects log** Every row removed, with the reason it was removed
- Decisions log** Every choice made during cleaning, with its reason and row count
- Identity rule** The fields that decide whether two rows are the same order
- Near-duplicate** Two rows sharing an id and differing on something else
- Truncated file** A complete file that stops early, usually a cut transfer
