# which five moves carry a decision to the people who lose under it?

Week 4, Tuesday. The shop, the school and the canteen are invented; Uber, Hyderabad is an illustrative case: the company is real, the situation and the data are synthetic, built for this class.

## 1 What are Tuesday's five topics, and where is each applied?

**Crux.** Say the claim, cut to it, hold it under challenge, size what it needs, and write it down.

## 2 The one-slide answer: what does a slide carry?

| Part | Ramesh's shop (invented) |
|---|---|
| Claim, the title | The longer hours add Rs 700 a day but earn less per hour, so count the evening on its own |
| Evidence, with its denominator | Sales per hour: Rs 1,190 in September, Rs 1,050 in October; each added hour at most Rs 350 |
| Caveat, beside it | A festival fortnight fell inside October |
| Action, cost, who signs | Keep the hours through November, decide after thirty days; Rs 170 a day; Ramesh signs |

**Crux.** Divide by what the decision buys: two added hours, at most Rs 350 each against Rs 1,190.

## 3 What to leave out, and the appendix: where does the rest go?

| Ask of each element | If yes |
|---|---|
| Does the claim need it? | It stays on the slide |
| Will a named person ask about it? | It goes to that person's page, headed by their question |
| Is it the caveat? | It stays, whatever else leaves |

**Crux.** Ramesh's eight elements: three stay, four go to two pages, and the rain days, two each month, leave.

## 4 Defending under challenge: how do you hold a claim?

| Move | At Gulmohar Secondary School (invented) |
|---|---|
| Restate | "You are saying attendance rose because the exams began." |
| Answer | Weeks 3 to 5 sit 4.7 points above last year's, before any exam |
| Concede | Exam weeks run about 8 points higher, in both years |
| Change my mind | The same rise at a school with the old timetable |

**Crux.** Concede the true part out loud; overclaiming and retreating both lose the room.

## 5 The guesstimate: how big is an unknown?

| Step | The canteen's tea (invented) |
|---|---|
| Clarify | One canteen, one weekday, cups of tea |
| Map | Students x share who buy x cups each |
| Calculate | 3,000 x 0.45 x 2 = 2,700; the share sets 1,500 to 3,900 |
| Validate | The till's 2,340: same unit, period and definition |

**Crux.** Check in the same unit, period and definition, and move the answer if the check says so.

## 6 The AI-free written business case: what must a page carry?

| Sentence | Carries |
|---|---|
| First | The claim, with what to do and why |
| Second | One number, what it is divided by, its window |
| Third | The caveat, before the action |
| Last | The action, its cost in rupees and weeks, who signs |
| Throughout | No method word: "divided by", never "denominator" |

**Crux.** Five rules, one page, read alone in two minutes.

## 7 What does Uber's city head take to Thursday?

| Read | All driver-weeks |
|---|---|
| Per peak online hour | Rs 314 to Rs 260, down 17 percent |
| Per active driver-week | Rs 5,817 to Rs 5,861, up 0.8 percent |
| Per trip | Rs 165 both windows |
| Drivers at the evening peak | About 5,000 to 5,700 where the chain and the check agree, inside 2,900 to 8,600 set by trips per person |

**Crux.** The scheme pays per online hour, so the slide reads per online hour.

## THE WORDS ON THIS SHEET

**Claim** The sentence the slide wants the reader to act on

**Denominator** What a total is divided by

**Caveat** What the evidence cannot show yet

**Appendix page** A page behind the slide, headed by one reader's question

**Objection** The reason a listener gives for not accepting a claim

**Concede** To say an objection's true part out loud

**Guesstimate** A rough count of something nobody has measured

**Range** The lowest and highest answer you would still defend
