

functions, failures and the file boundary

Week 1, Day 2. Print landscape. Six panels, pictures only. The text sheet beside this one carries the words.

1 what a function hands back

Crux. if the caller needs the answer, the function returns it.

2 reading a traceback

Crux. read the last line first, every time.

4 who decides what a failure means

Crux. convert or refuse in the function, decide what it means in the caller.

5 two agreements about structure

Crux. everything a CSV agrees to is text, and JSON breaks all at once.

3 three stances on the same bad row

Crux. a bare except turns a failure into a claim you cannot support.

6 the reconciliation

Crux. a record in neither file is a record nobody will ever look for again.

THE WORDS ON THIS SHEET

Function One decision, named, with one home, callable again

return against print `print` shows a person, `return` hands a value to the next line

Traceback The stack of calls that led to a failure, read from the bottom

Named exception Catching the failure you expected and nothing else

raise Refusing on purpose, with your own wording and the offending value

Rejects log One row per record you could not use, each with its reason

Reconciliation Input equals clean plus rejected, asserted every run

File format An agreement about structure, and nothing more than it states
